VARNI HOLIDAYS

SOFTWARE REQUIREMENTS SPECIFICATION

Phase 1 | Customer Website + Employee CRM + Admin Portal

DOCUMENT CONTROL	DETAIL
Project	Varni Holidays Website Redesign and Internal Management System
Document type	Software Requirements Specification (SRS)
Version / status	0.1 - Working Draft for requirement confirmation
Prepared date	04 November 2026
Business location	Anand, Gujarat, India
Existing website	https://varnitours.com/
Primary administrator	Neel Patel (proposed Super Admin account owner)
UI reference	Warm Tactile Voyage - light ivory, ocean blue and gold Stitch design

DOCUMENT STATUS This draft captures the requirements explained so far. It is not a final signed scope. Items marked TBD / Decision Required must be confirmed before implementation.

Your Gateway to Joyful Holidays

Document Map

Section	Contents
1	Purpose, vision and objectives
2	Scope and release boundaries
3	Users, roles and permissions
4	Website information architecture and UI direction
5	Customer-facing functional requirements
6	Employee CRM and lead lifecycle
7	Admin portal requirements
8	Business rules and pricing logic
9	Conceptual data model
10	Notifications and communication
11	Security, privacy and auditability
12	Non-functional requirements
13	Acceptance criteria and test scenarios
14	Phase 2 roadmap / exclusions
15	Open decisions and client confirmations
16	Assumptions and constraints
17	Change control and approval

Reading note: This SRS distinguishes confirmed requirements from recommended design decisions and unresolved questions. The development team must not treat TBD items as approved behaviour.

1. Purpose, Vision and Objectives

This SRS defines the expected behaviour of the Varni Holidays Phase 1 platform. The product consists of a customer-facing travel website connected to a secure internal system used by employees and administrators to receive enquiries, manage customer relationships, configure tour packages and communicate progress.

1.1 Product vision

Create a premium, trustworthy travel experience where customers can enquire about flights, tour packages and visa assistance, while Varni Holidays employees can manage every enquiry through a controlled, traceable workflow.

1.2 Primary business objectives

- Generate structured enquiries for three priority business categories: Flights, Tour Packages and Visa Assistance.
- Capture the complete search or form context together with customer contact information.
- Centralise all leads and customer records in a controlled database.
- Give employees a clear Requests → General → Priority → Converted/Booked pipeline.
- Allow the Super Admin to create employees and assign one or more service roles.
- Allow authorised staff to configure packages and occupancy/night-based prices without code changes.
- Provide customers with timely, accurate progress updates that build trust.
- Protect customer personal information through role-based access, audit logs and secure handling.

1.3 Success measures

Measure	How it is measured
Enquiry capture	Submitted enquiries stored with a unique reference and service type.
Lead response	Time from enquiry submission to first employee activity.

Measure	How it is measured
Pipeline conversion	Counts and rates across Requests, General, Priority and Converted.
Package accuracy	Displayed estimate matches the active server-side pricing configuration.
Communication reliability	Email / WhatsApp notification delivery and failure logs where integrations are enabled.
Data accountability	Every important stage change and customer update has an actor and timestamp.

2. Scope and Release Boundaries

2.1 Phase 1 included scope

Area	Phase 1 capability
Public website	Responsive website with Flights, Tour Packages and Visa as the three primary customer paths, plus supporting brand and contact content.
Flight enquiries	Flight search form; contact capture modal; country-aware phone input and validation; save complete search and customer data. No live flight API.
Tour packages	Package listing and details; Kerala demonstration package; configurable person/night pricing; enquiry capture with selected configuration saved.
Visa enquiries	Visa information and enquiry form capturing destination, visa category, purpose and travel context.
Employee portal	Role-aware workspace to view, assign, contact, qualify and progress leads; customer profiles; interaction history; progress updates.
Admin portal	Super Admin controls for employee accounts, multi-role assignment, package content and price configuration, lead oversight, settings and reports.
Database	Central relational data store for users, roles, enquiries, customers, packages, pricing, activities, updates and audit history.
Communications	Email notifications and a defined WhatsApp communication approach; automated chatbot is deferred.

2.2 Explicitly out of scope for Phase 1

- Live flight search results, fare rules, ticket issuance, airline booking or payment through a flight API.
- Live hotel inventory, room availability or third-party booking engine integrations.
- Automatic visa application submission to embassies, consulates or government portals.
- Automated WhatsApp conversational bot with menus / AI responses (planned for a later phase).
- Customer self-service login portal unless approved as a separate requirement.
- Online payment gateway, refunds, accounting integration or automatic invoice generation unless added through approved change control.
- Collection and long-term storage of passport scans or other sensitive identity documents unless a secure document-handling requirement is separately approved.

SCOPE CONTROL A lead/enquiry platform is not an online ticketing platform. The website will collect the customer request; Varni Holidays staff will handle supplier checks, quotations and booking operations manually in Phase 1.

2.3 Later-phase candidates

- WhatsApp Business chatbot: greeting, service menu, FAQ, enquiry creation and human handover.
- Live flight / hotel supplier integrations where commercial access and API credentials are available.
- Customer portal for viewing booking history, documents and progress timeline.
- Secure visa document upload and case tracking.
- Online payments, receipts, invoices and automated balance reminders.

3. Users, Roles and Permissions

3.1 User types

Role	Description	Main permissions
Public visitor	Unauthenticated person browsing the website.	View content, search destinations/packages, submit flight/package/visa enquiries.
Employee	Authenticated staff member with assigned service role(s).	View and work on permitted leads; contact customers; log activities; update lead stages; send approved updates.
Flights Agent	Employee assigned Flight role.	Access flight enquiries and permitted customer records.
Packages Agent	Employee assigned Packages role.	Access package enquiries, package details and permitted pricing/booking operations.
Visa Agent	Employee assigned Visa role.	Access visa enquiries and case notes; restricted access to sensitive documents if introduced.
Super Admin	Neel Patel is the initially designated business owner/admin.	Full system control: employees, roles, content, pricing, leads, settings, audit and reports.

3.2 Role assignment model

- A single employee may have one or multiple service roles (for example, Flights + Packages).
- The Super Admin creates, edits, disables and reactivates employee accounts.
- Role permissions must be enforced by the backend, not only by hiding UI elements.
- Employees should see only the service queues and records permitted by their assigned roles, unless an explicit shared-access permission is granted.
- Only the Super Admin can grant or revoke administrative permissions.

3.3 Account lifecycle

Admin creates employee → assigns one or more roles → employee receives secure activation/reset flow → employee signs in → account can be disabled by admin. Disabled employees must lose access immediately; their historical actions remain in audit logs.

RECOMMENDATION Use named accounts for every employee. Do not share one common employee login. This is necessary to know who viewed, changed or contacted each customer.

4. Website Information Architecture and UI Direction

4.1 Selected UI theme

The selected Stitch direction is “Warm Tactile Voyage”, based on the supplied board screenshot. It is a light premium travel aesthetic, not the later dark-cinematic alternative.

Design token	Selected direction
Primary	Deep ocean/navy blue #153650
Secondary	Ocean blue #24689B
Accent	Warm gold #E9B95E
Neutral background	Warm ivory #F8F6F0
Headings	Playfair Display
Body / UI	Plus Jakarta Sans
Surfaces	Warm white/cream, subtle soft shadows and rounded cards
Visual style	Premium editorial travel photography, soft tactile surfaces, calm spacious layouts

4.2 Proposed public sitemap

Page / area	Purpose
Home	Brand introduction and three primary service paths: Flights, Packages and Visa.
Flights section / page	Collect route, date, passenger and cabin preferences; then capture contact details.
Packages listing	Browse available packages, filter and open details.
Package detail	Photos, overview, duration, itinerary, inclusions/exclusions, pricing selector and enquiry form.
Visa section / page	Explain visa assistance and capture country, visa type, purpose and applicant details.
About / Why Varni	Company introduction and verified differentiators.
Contact	Official contact channels, location and general enquiry.
Legal pages	Privacy notice, terms and enquiry/booking disclaimers.

4.3 Homepage hierarchy

1. Header with Varni Holidays brand, primary navigation and contact/Plan Your Trip CTA.
2. Hero section with selected Warm Tactile Voyage visual style and clear travel-planning message.
3. Primary service journey 1: Flights search module.
4. Primary service journey 2: Featured packages and package discovery.
5. Primary service journey 3: Visa assistance overview and CTA.
6. Supporting sections: popular destinations, why choose Varni, testimonials (approved content only), contact CTA and footer.

The three main categories must be visually easy to discover. They may be presented as distinct homepage sections with clear scroll/navigation anchors or as dedicated pages linked from the homepage. Final section order and exact layout must follow the approved Stitch screens.

5. Customer-Facing Functional Requirements

5.1 Flight enquiry flow

Business rule: Phase 1 captures flight intent; it does not query live airline inventory or issue tickets.

ID	Requirement
FR-FLT-01	The visitor can choose trip type (one-way / round-trip; multi-city only if approved), origin and destination.
FR-FLT-02	The form captures departure date and, where applicable, return date.

ID	Requirement
FR-FLT-03	The form captures passenger counts by adult, child and infant; cabin class is selectable.
FR-FLT-04	On search submit, the system validates required route/date/passenger fields and opens a contact-details modal or equivalent step.
FR-FLT-05	The contact step captures full name, email address and phone number with country calling-code selector.
FR-FLT-06	Phone validation must be country-aware and validate plausible international number length/format; do not hard-code “10 characters” for every country. Store normalised international number where possible.
FR-FLT-07	After successful submission, persist the full flight search criteria and contact data as a Flight enquiry with unique lead reference, created timestamp and initial stage Requests.
FR-FLT-08	Show a clear success message and enquiry reference; do not display fake flight results or availability.
FR-FLT-09	Notify the appropriate employee queue/admin that a new Flight enquiry has arrived.

5.1.1 Flight fields (proposed minimum)

Field	Type / validation	Required
Trip type	One-way / Round-trip; multi-city pending decision.	Yes
From / To	Airport/city autocomplete or searchable selector; origin and destination must differ.	Yes
Departure date	Date; must not be in the past.	Yes
Return date	Date; on/after departure; required for round-trip.	Conditional
Adults / children / infants	Integer counts; at least one passenger overall; age definitions TBD.	Yes
Cabin class	Economy / Premium Economy / Business / First (confirm list).	Recommended
Name	Non-empty full name.	Yes
Email	Valid email format.	Yes
Phone	Country code + national number; country-aware validation.	Yes

5.2 Tour package browsing and enquiry

ID	Requirement
FR-PKG-01	Visitors can browse published packages and open an individual package detail page.
FR-PKG-02	Package detail shows destination, title, duration, images, overview, day-wise itinerary, inclusions, exclusions, important notes and price basis.
FR-PKG-03	The customer can select traveller count and number of nights from admin-configured allowed values/ranges.
FR-PKG-04	The displayed estimate updates when traveller count or nights change, using the currently active package pricing configuration.
FR-PKG-05	The price calculation must be performed or validated server-side before saving an enquiry; client-side display alone is not authoritative.

ID	Requirement
FR-PKG-06	On enquiry, collect name, email, country-aware phone and relevant trip preferences.
FR-PKG-07	Save package ID, selected traveller mix, nights, dates (if collected), displayed/calculated amount, currency and pricing-rule version/snapshot with the enquiry.
FR-PKG-08	The system creates a unique Package enquiry in Requests and notifies the Packages queue.
FR-PKG-09	Only published/active packages are publicly visible. Admin can draft, publish, unpublish or archive packages.

5.2.1 Initial Kerala demonstration package

Phase 1 should contain one admin-managed Kerala sample package so the team can demonstrate the full package flow and price selector. The package should be editable from the Admin Portal; it must not be hard-coded into the frontend.

DURATION CONFLICT TO CONFIRM The brief says “6 day 7 night”. Days and nights appear inconsistent. A common travel format is 7 Days / 6 Nights, but this SRS does not assume that is the intended package. Confirm the exact duration, itinerary, price and inclusions before publishing.

5.3 Visa enquiry flow

The Visa journey is enquiry-based in Phase 1. The website collects enough information for an employee to understand the customer’s request and follow up. It does not submit an application to an embassy or government portal.

ID	Requirement
FR-VIS-01	Visitor can choose destination country and visa category.
FR-VIS-02	Capture purpose of travel (tourism, business, study, work, transit, other).
FR-VIS-03	Capture nationality/passport country and current country of residence, subject to confirmation of necessity.
FR-VIS-04	Capture planned travel date, intended duration of stay and number of applicants where relevant.
FR-VIS-05	Capture name, email and country-aware mobile number.
FR-VIS-06	Allow an optional free-text note for special circumstances.
FR-VIS-07	Create a Visa enquiry with all submitted fields, unique reference and Requests stage.
FR-VIS-08	Notify the Visa queue/admin.
FR-VIS-09	Do not require passport scans or bank statements in Phase 1 unless secure document upload is separately approved.

5.3.1 Recommended visa form fields

Field	Reason
Destination country	Identifies where the customer intends to travel.
Visa type	Tourist / Business / Student / Work / Transit / Other.
Travel purpose	Context for the visa team.
Nationality	May affect eligibility and document requirements.
Current residence country	May affect application location and process.
Planned travel date	Helps determine urgency.
Stay duration	Provides basic trip context.
Applicant count	Individual / family / group handling.

Field	Reason
Contact details	Allows staff follow-up.
Additional notes	Captures special circumstances.

6. Employee CRM and Lead Lifecycle

6.1 Employee home / dashboard

- Show a summary of new Requests assigned to the employee or their role queues.
- Show counts for Requests, General, Priority and Converted/Booked.
- Provide service filters: Flights, Packages and Visa.
- Provide search by lead reference, customer name, email or phone, subject to access rights.
- Show follow-up due items and recent activity.
- Display unread/new assignment indicators without exposing data to unauthorised roles.

6.2 Pipeline stages

Stage	Meaning	Expected action / exit condition
Requests	New website enquiry not yet processed.	Employee reviews, claims/assigns if needed and initiates first contact.
General	Employee has attempted/established contact and the enquiry is being handled.	Record contact result, needs, quote discussion and next follow-up.
Priority	Customer has expressed strong interest or is likely to proceed.	Prioritise follow-up; collect relevant customer details with notice/consent; prepare next steps.
Converted / Booked	Customer has confirmed a booking or the business marks the lead as successfully converted.	Create booking record or conversion details; maintain activity and customer update history.
Closed - Not Converted	Customer declines, is unreachable after policy-defined attempts, or enquiry is no longer active.	Record close reason; retain history per retention policy.

PIPELINE RULE Priority is a qualification stage, not proof of purchase. Converted/Booked is a separate outcome. Closed - Not Converted is recommended so rejected or inactive leads do not remain forever in an active queue.

6.3 Lead card and detail view

- Lead card shows customer name, service type, submitted date/time, reference ID, destination/route/package/visa type summary, current stage and assigned employee.
- Opening a lead shows all original submitted data and the full history of later changes.
- Employee can change stage only if permitted by role and workflow.
- Employee can add internal notes, next follow-up date, contact outcome and priority reason.
- Employee can assign/reassign the lead if permission is granted.
- Sensitive fields must be masked or hidden from roles that do not need them.

6.4 Customer profile and relationship history

When a lead is submitted, the system should identify whether the customer already exists using a carefully designed match strategy (normalised phone and/or email). If matched, attach the new enquiry to the existing customer profile; if not, create a new profile. Conflicting matches must be flagged for staff review rather than silently merging two people.

- Customer profile contains basic contact information and linked enquiries/bookings.

- Profile timeline records stage changes, calls, emails, WhatsApp interactions, employee notes and customer-facing updates.
- Date of birth should be collected only when justified (for example, a priority/converted customer) and with clear notice/consent. It must not be mandatory for a simple flight/package/visa enquiry.
- Birthday messages should only be sent where the customer has opted in to marketing/occasion messages; provide opt-out handling.

6.5 Contact and activity logging

Activity	Required stored details
Call	Date/time, employee, outcome (answered / no answer / callback / not interested / other), note and next follow-up date.
Email	Recipient, subject/template, timestamp, sending status/provider message ID if integrated, employee/system actor.
WhatsApp	Recipient, message/template, timestamp, delivery status if API-enabled; otherwise record manual interaction and actor.
Internal note	Author, timestamp, note text, visibility restricted to employees/admin.
Stage change	Old stage, new stage, actor, timestamp, reason.
Customer update	Update category, customer-visible message, related service/booking component, channel and delivery status.

6.6 Customer progress updates

Employees need a customer update action to share transparent progress, for example: “Thank you for choosing Varni Holidays”, “Hotel reservation requested/confirmed”, “Flight reservation completed” or “Your itinerary is ready”.

- Employee selects an update category and related enquiry/booking.
- Employee enters or selects an approved message template and reviews the recipient/channel before sending.
- The system records who sent the update, when, content/template version, channel and delivery result.
- Only state “confirmed/booked” when staff have verified the supplier confirmation. Use “requested” or “pending confirmation” when it is not yet confirmed.
- Customer-facing updates should not expose internal notes, supplier login details or staff-only comments.

TRUST REQUIREMENT Progress updates must reflect verified operational status. A message that says “flight booked” when it is only requested would damage the trust this feature is designed to build.

7. Admin Portal Requirements

7.1 Admin dashboard

- Total enquiries today / this month.
- Enquiries by Flights, Packages and Visa.
- Lead counts by Requests, General, Priority, Converted/Booked and Closed.
- Conversion rate by service and by employee.
- Unassigned and overdue follow-ups.
- Recent bookings/customer updates.
- Email / WhatsApp notification failures where available.

7.2 Employee and role management

- Create employee with name, email, mobile and account status.
- Assign one or multiple roles: Flights Agent, Packages Agent and Visa Agent.
- Support future role expansion without redesigning authentication.

- Edit role assignments and disable/reactivate accounts.
- Reset access via secure process; never display stored passwords to admin.
- View employee activity and assigned workload.

7.3 Package and pricing management

- Create package from scratch using structured fields and image uploads.
- Edit destination, duration, description, itinerary, inclusions, exclusions and status.
- Configure traveller options, night options and pricing rules for each package.
- Preview calculated price for combinations before publishing.
- Set effective-from / effective-to dates for seasonal price changes if required.
- Publish, unpublish, archive and duplicate packages.
- Record who changed pricing, what changed and when.

7.4 Enquiry and customer management

- View/search/filter all enquiries across all services, subject to role permissions.
- Assign/reassign leads to employees.
- Change pipeline stage and close reason.
- View customer profile and enquiry history.
- Merge duplicate customer records only through an authorised, auditable action.
- Export approved enquiry/customer reports with audit logging.
- View customer communication and update history.

7.5 Settings and content management

- Manage website contact information, social links and footer details.
- Manage homepage featured destinations/packages and service descriptions.
- Manage notification templates and sender details.
- Configure lead assignment rules and follow-up defaults.
- Configure allowed phone countries, currency display and time zone.
- Manage privacy/terms links and notice text with version history.

7.6 Reports

Report	Filters / breakdowns
Enquiry report	Date range, service type, stage, source, employee, location.
Conversion report	Service type, employee, month, converted vs closed.
Follow-up report	Due, overdue, completed, missed.
Package performance	Package views/enquiries if analytics are implemented; enquiries by package.
Revenue / booking report	Only if actual booking values and payments are captured; not inferred from enquiry prices.

8. Business Rules and Pricing Logic

8.1 Package pricing engine

Pricing must be configurable in the Admin Portal. The frontend must not contain package-specific hard-coded price calculations. A price configuration can use traveller count and number of nights, as explicitly required by the business.

Input	Example combinations to support
Traveller quantity	2 persons; 5 persons; 6 persons.

Input	Example combinations to support
Number of nights	2 nights; 5 nights; other admin-configured values.
Package	Kerala demonstration package initially; additional packages later.
Optional future inputs	Adult/child split, room sharing, travel date/season, hotel category, add-ons. These are TBD, not assumed for initial pricing.

8.2 Pricing configuration approaches

Model	How it works	Trade-off
Exact matrix (recommended for initial launch)	Admin enters a price for each supported traveller-count and night-count combination or band.	Predictable and easy to audit; admin must fill supported combinations.
Rule-based formula	Admin defines base rate, per-person/per-night adjustments and supplements.	Flexible but requires a clearly agreed formula and careful testing.
Hybrid	Use matrix for approved combinations, fallback to enquiry-only for unsupported selections.	Safe where prices are not available for every combination.

RECOMMENDED DEFAULT Start with an exact price matrix or explicit traveller bands x night counts. If a combination has no configured price, show “Request a quotation” rather than inventing/interpolating a value.

8.3 Price integrity rules

- Every price has currency (default expected INR, confirmation required), amount, package, applicable guest/night combination and active status.
- The server recalculates the amount when the customer submits the enquiry.
- Save a snapshot of the selected inputs, calculated price, currency and pricing configuration/version on the enquiry.
- Changing the package price later must not rewrite the historical estimate saved on an old enquiry.
- Clarify whether the displayed amount is total trip price, per-person price, or starting-from price.
- Clarify taxes, service charges, child pricing, room sharing and inclusions before finalising the production formula.

8.4 Lead rules

- Every successful enquiry receives a unique human-readable reference ID.
- Initial stage is Requests.
- Each lead must have one service type: Flight, Package or Visa (general enquiry may be a separate type if approved).
- A lead has an owner/assignee or is visible in an unassigned role queue.
- Stage transitions and assignment changes are timestamped and attributable.
- Closed leads require a close reason.
- Repeat enquiries may be linked to an existing customer but remain separate enquiry records.

9. Conceptual Data Model

The following is a conceptual entity list for database design. Exact table names, field types, indexes and relationships will be finalised during technical design.

Entity	Purpose / key relationships
User	Login identity for admin and employees; status, email, phone, password hash / auth provider reference.

Entity	Purpose / key relationships
Role	Flights Agent, Packages Agent, Visa Agent, Super Admin and future permissions.
UserRole	Many-to-many mapping so one employee can hold multiple roles.
Customer	Canonical customer profile and contact preferences; can have many enquiries.
Lead / Enquiry	Common lead record: reference, service type, customer, stage, assignee, source, timestamps.
FlightSearchDetail	Route, trip type, dates, passengers, cabin class linked to Flight lead.
Package	Package content, destination, duration, itinerary, publication state.
PackagePricingRule	Package-specific price matrix/rules, traveller band, nights, amount, currency, validity.
PackageEnquiryDetail	Selected package, person mix/count, nights, travel preferences, price snapshot.
VisaEnquiryDetail	Destination, visa category, purpose, nationality, residence, travel date, stay duration, applicant count.
LeadActivity	Calls, notes, tasks, stage changes, assignment changes and follow-up history.
CustomerUpdate	Customer-visible progress message related to enquiry/booking and channel.
NotificationLog	Email/WhatsApp message metadata, template, provider status, retry/error details.
ConsentRecord	Consent type, purpose, version, timestamp, source and opt-out state.
AuditLog	Security-relevant actions and changes, actor, entity, timestamp and before/after summary.
Booking (recommended)	Confirmed service/trip record created when a lead converts; may link to one or more service components.

9.1 Relationship overview

- One Customer can have multiple Leads/Enquiries.
- One Lead belongs to one service category and can have service-specific detail.
- One Lead can have many LeadActivity records and CustomerUpdate records.
- One Employee/User can have multiple Roles and many assigned Leads.
- One Package can have many PricingRules and PackageEnquiry records.
- One Lead may convert into a Booking; booking may later contain service components such as flight, hotel or transfer.
- Every sensitive or important workflow action should be traceable through Activity or AuditLog.

10. Notifications and Communication

10.1 Phase 1 communication

The brief expects the team to contact leads through email and WhatsApp. The precise automation level depends on whether Varni Holidays has an approved WhatsApp Business Platform provider/account and the needed templates/permissions.

Event	Email	WhatsApp
New enquiry received	Notify assigned queue/admin; optional customer acknowledgement.	Optional approved acknowledgement if provider/API is configured; otherwise employee uses manual contact.
Quotation/update	Send approved customer-facing email.	Send approved template if WhatsApp API is configured; otherwise log manual message.

Event	Email	WhatsApp
Booking progress	Send verified progress update.	Send verified update using approved template/API or log manual communication.
Birthday	Only if DOB and marketing/occasion consent exist.	Deferred unless approved messaging templates and opt-in exist.

10.2 Email requirements

- Use a verified sender domain and transactional email provider selected by the business.
- Templates must support customer name, enquiry reference, service, update text and relevant contact links.
- Log success/failure and provider message ID where available.
- Avoid sending sensitive passport or financial details in plain email.
- Provide an unsubscribe/opt-out mechanism for promotional or birthday messages; transactional notices should be distinguished from marketing.

10.3 WhatsApp requirements

- Use official WhatsApp Business Platform or an approved BSP; do not automate a personal WhatsApp account.
- Template approvals, opt-in, messaging windows and provider costs must be confirmed.
- Keep an interaction log even when an employee manually contacts a customer.
- The conversational bot with greeting and three options is Phase 2, not a Phase 1 dependency.

11. Security, Privacy and Auditability

Customer data is a core business asset. Security must be designed into the platform from the beginning, not added after the CRM is operational.

11.1 Access controls

- Implement backend-enforced role-based access control (RBAC).
- Require individual logins and secure password handling or a trusted authentication provider.
- Use multi-factor authentication for Super Admin; strongly recommended for employees.
- Apply least-privilege access by service role and assigned ownership.
- Expire sessions and revoke sessions when an employee is disabled or permissions change.

11.2 Data protection

- Use HTTPS/TLS for every page and API request.
- Use parameterised database access and server-side input validation.
- Protect endpoints with rate limits, anti-bot controls and abuse monitoring.
- Store secrets/API keys only in server-side environment secrets; never expose them in browser code or source repositories.
- Encrypt backups and sensitive data at rest where supported by the hosting/database provider.
- Restrict access to exports; log who exports customer data.
- Do not collect unnecessary sensitive data. In particular, do not collect passport/bank documents in Phase 1 by default.

11.3 Audit and retention

- Log employee/admin login and important administrative actions.
- Record changes to lead stages, assignments, package prices, roles and customer-facing updates.
- Define retention and deletion periods for inactive leads and customer records with the business.
- Support a process to correct inaccurate customer data and honour applicable privacy requests.
- Maintain encrypted backups and test restore procedures.

12. Non-Functional Requirements

Category	Requirement
Performance	Key public pages should load quickly on typical mobile networks; target Core Web Vitals should be measured before launch. Define quantitative targets during technical design.
Responsiveness	Support desktop, tablet and mobile layouts; target widths include 1440px, 1280px, 768px and 390px.
Accessibility	Readable contrast, keyboard navigation, labelled form inputs, visible focus states and accessible validation messages.
Reliability	Failed enquiry submissions must not be silently lost; show error feedback and support safe retry without duplicate submissions.
Data consistency	Enquiry, customer, price snapshot and notification records must be transactionally consistent where applicable.
Scalability	Data model and service queues should support additional employees, service categories and growing enquiry volumes.
Maintainability	Package content and pricing should be managed in admin without frontend code edits.
Observability	Server errors, failed integrations, email/WhatsApp delivery failures and important job failures should be logged.
Compatibility	Support current mainstream versions of Chrome, Edge, Safari and Firefox.
Backup / recovery	Define backup frequency, retention, recovery point and recovery time objectives before production launch.

13. Acceptance Criteria and Test Scenarios

ID	Scenario	Expected result
AT-01	Visitor submits a valid Flight enquiry.	Contact modal validates; one Flight lead is saved in Requests with all search criteria and contact data; reference is shown.
AT-02	Visitor enters invalid email or invalid phone for selected country.	Submission is blocked with clear field-level error; no incomplete lead is created.
AT-03	Visitor selects round-trip but return date is before departure.	Validation prevents submission.
AT-04	Visitor submits a Package enquiry with traveller count and nights.	Correct configured price is displayed and server-validated; selections and price snapshot are saved.
AT-05	Customer selects a package combination with no configured price.	System does not invent a price; it offers a quotation request or prevents price display per approved rule.
AT-06	Visitor submits Visa enquiry.	Visa-specific fields and contact details are saved as a Visa lead in Requests.
AT-07	New lead arrives.	Correct service queue/admin is notified and lead is visible to authorised employee(s).
AT-08	Employee moves a lead from Requests to General.	Stage changes and audit/activity entry records actor and timestamp.
AT-09	Employee promotes a lead to Priority.	Lead appears in Priority; stage reason/activity is logged.
AT-10	Employee marks lead Converted/Booked.	Conversion is recorded separately from Priority; booking details are recorded/linked.
AT-11	Admin assigns Flights and Packages roles to one employee.	Employee can access both permitted queues and no unassigned restricted areas.
AT-12	Admin edits a package price.	New enquiries use new active price; historic enquiry price snapshots remain unchanged.

ID	Scenario	Expected result
AT-13	Employee sends customer progress update.	Approved message is sent through configured channel and logged with status.
AT-14	Employee account is disabled.	Employee cannot sign in or use existing sessions; their past actions remain attributed.
AT-15	Unauthorised employee attempts to access restricted Visa/customer data.	Backend denies access even if the user manually calls the API.

14. Phase 2 Roadmap / Exclusions

Candidate feature	Description	Dependency
WhatsApp chatbot	Business number replies to “Hi” with a menu (for example Flights, Packages, Visa) and routes users through a guided enquiry.	WhatsApp Business Platform/BSP, approved templates, opt-in and bot conversation design.
Live flights	Live search/fare availability/ticketing.	Commercial contract, API documentation, credentials and operational support.
Customer portal	Customer login and enquiry/booking timeline, documents and payment status.	Identity, privacy and account-support design.
Visa document workflow	Secure upload, access permissions, expiry and case status.	Document retention policy, secure object storage and access audit.
Payments	Advance/full payment, receipts, refunds and balances.	Gateway account, commercial/legal terms and reconciliation process.
Hotel / cruise integrations	Search and book through suppliers.	Supplier/API access and booking operations agreement.

15. Open Decisions and Client Confirmations

The points below are not fully specified yet. They should be resolved before the SRS is approved and before implementation locks its database schema and user experience.

ID	Decision required	Recommended starting point / notes
OD-01	Kerala package duration: 6 days / 7 nights or 7 days / 6 nights?	Confirm actual duration and day-wise itinerary. Do not publish the sample until confirmed.
OD-02	Package price meaning: total trip price or per-person?	Decide the display label and calculation basis, including taxes and inclusions.
OD-03	Pricing combinations: exact person counts or traveller bands?	Start with admin-configured exact matrix / bands by number of travellers and nights. Define unsupported-combination behaviour.
OD-04	Are adult/child/infant counts needed for packages?	Recommended to capture adults and children separately if child prices differ.
OD-05	Can nights be freely selected or only preset options?	Use admin-configured minimum, maximum and step/preset values for each package.
OD-06	Flight search: one-way, round-trip and multi-city?	Start with one-way and round-trip; multi-city can be deferred if not operationally required.
OD-07	Flight passenger categories and cabin classes?	Confirm child/infant age rules, max passenger count and supported cabin classes.
OD-08	Phone validation countries?	Support international country selector; confirm whether India should be preselected. Use real phone-number metadata validation.
OD-09	Lead assignment: automatic by service role or manual by admin?	Recommended: role-based queue plus manual assignment; optional round-robin later.
OD-10	Who can move stages and close leads?	Define employee vs manager permissions and close reasons.
OD-11	Does customer receive a progress timeline or only messages?	Phase 1 recommendation: internal timeline + email/WhatsApp updates; customer portal later.

ID	Decision required	Recommended starting point / notes
OD-12	Email provider and sender domain?	Confirm business-owned sender address and provider account.
OD-13	WhatsApp requirement for Phase 1?	Confirm official Business Platform/BSP and whether outbound templates are required now; chatbot stays Phase 2.
OD-14	Birthday data and messaging?	DOB optional; require explicit occasion-message consent and opt-out.
OD-15	Customer duplicate matching?	Use normalised phone/email with a manual merge review for conflicts.
OD-16	Does Phase 1 need customer login?	Not currently required by the brief; recommend defer unless client approves.
OD-17	Which official contact details and address should appear?	Client must verify all phone numbers, email, WhatsApp and address before launch.
OD-18	Hosting, domain, database and backup ownership?	Confirm account ownership and access process; do not put credentials in this document.
OD-19	Currency, GST and tax display?	INR is likely but must be confirmed; establish whether package prices include/exclude taxes.
OD-20	Data retention and deletion policy?	Agree a retention schedule for leads, customer profiles, communication logs and backups.

16. Assumptions and Constraints

- The primary service categories for the first release are Flights, Packages and Visa.
- The business team manually contacts customers and handles supplier operations after receiving the enquiry.
- No live flight/booking API is available or planned for Phase 1 because of cost and operational choice.
- One Kerala package is seeded for demonstration; all package content/pricing must remain admin-configurable.
- Neel Patel is the initially designated Super Admin, subject to client confirmation and secure account setup.
- The selected design theme is the light Warm Tactile Voyage Stitch board supplied by the user.
- Email and WhatsApp automation scope depends on provider account ownership, permissions, template approval and costs.
- All sample destinations, package details, customer metrics, testimonials and ratings must be treated as placeholders until verified.

17. Change Control and Approval

Any feature not described in this SRS, or any change that affects the approved workflow, data model, integrations, timeline or cost, should be recorded as a change request. The change request must describe the reason, affected modules, impact and approval before implementation.

Approval	Name / role	Signature / date
Client representative	_____	_____
Business owner / Super Admin	Neel Patel (confirm)	_____
Development lead	_____	_____

NEXT DOCUMENTATION STEP Once the open decisions are answered, this draft can be baselined as SRS v1.0. Then prepare the ER diagram, detailed API contracts, wireframe inventory, permission matrix, test plan and phased Antigravity execution prompt.
